Empathy Map Canvas — Example: School IT Helpdesk (Food-ordering style layout, adapted)

User: A student reporting a Wi-Fi issue

WHO are we empathizing with?	What do they need to DO?
A student/teacher of the school who depends on network, projectors, systems and access credentials for daily academic work. Not technical — just wants the issue fixed.	Report the issue, describe it correctly, choose the right category, follow up on status, get back to their work.
What do they SEE?	What do they SAY?
Long helpdesk queues, friends facing the same issues, a plain ticket form with too many technical fields, silence after submitting.	"Wi-Fi has been down since morning." "I don't know which category this is." "Did anyone even see my ticket?" "It's the third time this month."
What do they DO?	What do they HEAR?
Ask friends/staff first, submit a ticket with a vague description, call the helpdesk repeatedly, switch to workarounds (mobile data, another room).	"Raise it on the portal and wait." "Mention the category correctly." "These issues keep repeating." "The staff is swamped."
PAINS	GAINS
Waiting without status; wrong categorization routing the ticket to the wrong team; no confirmation that the ticket exists; repeating the same details.	Instant acknowledgment; correct routing the first time; fast resolution of common issues; confidence that nothing was lost.

How our solution answers the map: the caller only fills Caller + Short description — the flow classifies the ticket automatically and emails confirmation instantly, removing the top pains (no acknowledgment, wrong routing) identified above.
