

Project Design Phase Solution Architecture

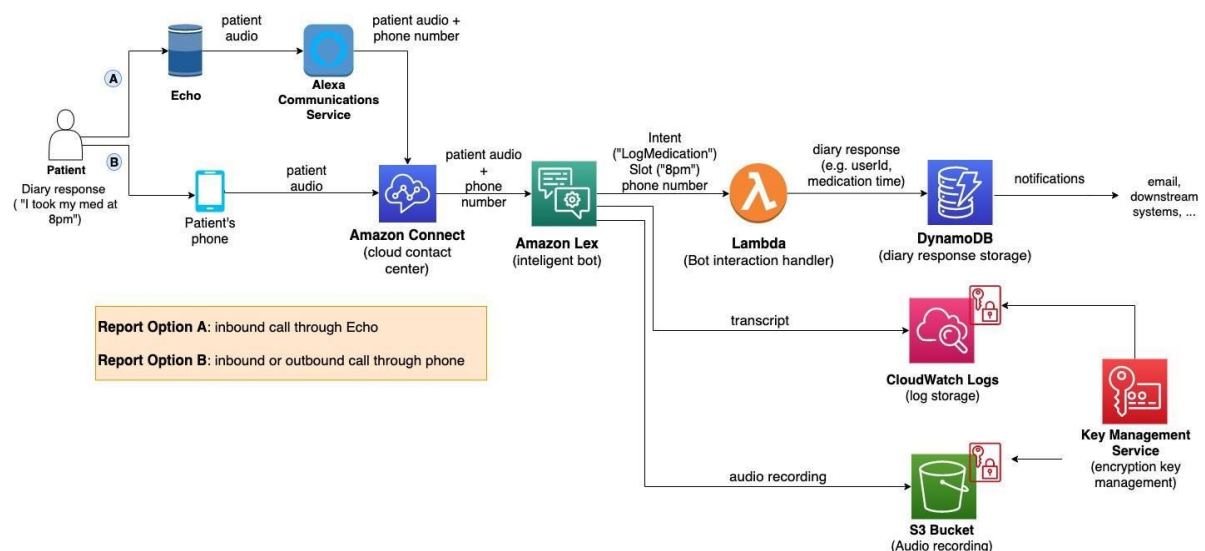

Date	2 October 2026
Team ID	6ab8b403c23107aaaa72d105 (Team 23)
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Solution Architecture:

Solution architecture is a complex process – with many sub-processes – that bridges the gap between business problems and technology solutions. Its goals are to:

- Find the best tech solution to solve existing business problems.
- Describe the structure, characteristics, behavior, and other aspects of the software to project stakeholders.
- Define features, development phases, and solution requirements.
- Provide specifications according to which the solution is defined, managed, and delivered.

Example - Solution Architecture Diagram:

Our solution architecture (Team 23): Caller submits the School IT Ticket form (ServiceNow Next Experience UI) -> Record-Created trigger on u_school_it_ticket (condition: Category is empty) -> Flow Designer flow 'Auto Classify School IT Tickets' evaluates Short-description keywords (If / Else-If logic) -> Update Record writes Category & Subcategory -> Send Email action queues the confirmation to the Caller's address (sys_email / SMTP). Data stores: u_school_it_ticket (tickets), sys_choice (dependent Category-Subcategory lists), sys_email (outbound mail). Deployment artifact: 'Project Update Set' (Complete, 35 customer updates, XML export). Environment: ServiceNow Zurich PDI nowlearning-nlinst04741515-242fm-0001.
