

Functional & Performance Testing Template

Model Performance Test

Date	02 October 2026
Team ID	6ab8b403c23107aaaa72d105 (Team 23)
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Test Scenarios & Results

Test Case ID	Scenario (What to test)	Test Steps (How to test)	Expected Result	Actual Result	Pass/Fail
FT-01	Ticket text input validation	Create tickets with a clear description and with missing/blank description.	Valid ticket text is processed; incomplete input is handled without flow failure.	Valid ticket text was processed and the flow handled incomplete input without creating an invalid classification.	PASS
FT-02	Ticket classification and field update	Create tickets representing different support issues and submit them through the flow.	Flow identifies the matching classification and updates the configured ticket fields.	Classification fields were updated according to the configured Flow Designer conditions.	PASS
FT-03	Assignment/routing action	Submit a ticket that matches a configured classification rule and observe the assignment action.	Ticket is routed to the configured assignment group/owner.	Ticket was routed to the configured assignment destination.	PASS
FT-04	Flow execution / integration check	Trigger the flow from a new or updated ticket and verify execution details.	Flow runs successfully and completes the configured actions without an execution error.	Flow completed successfully and the configured actions were executed.	PASS
PT-01	Response time test	Create a ticket and observe the time from submission to classification/field update.	Classification completes within the expected operational response time.	Classification completed within the expected response window during testing.	PASS
PT-02	Multiple-ticket processing	Submit multiple tickets sequentially and verify each execution.	Each ticket is processed independently without incorrect carry-over of classification.	Tickets were processed independently with the expected classification behavior.	PASS
PT-03	Repeat execution / stability test	Create and update test tickets repeatedly and observe flow execution.	Flow remains stable and does not crash or create duplicate unintended updates.	Repeated executions completed without an observed flow	PASS

				failure or unintended duplicate update.
