

Project Development Phase - Performance Testing

Project: Auto Ticket Classification using Flow Designer

Team: 6ab8b403c23107aaaa72d105 (Team 23) - Amirthavarshini J (Team Lead), Ashwanth S, Deepan M, Aaditya Srinivasan K S

Date: 2 October 2026

Scope

Performance validation of the 'Auto Classify School IT Tickets' Flow Designer flow on the School IT Ticket table (ServiceNow Zurich PDI nowlearning-nlinst04741515-242fm-0001).

Test results

Metric	Result	Verification
Classification latency	Within seconds of record insert (background flow)	Tickets SCH0001002-1006 all populated on first reopen after creation
Functional reliability	5 / 5 tickets classified correctly (100%)	Wi-Fi and Projector scenarios repeated across separate runs
Email delivery	5 / 5 confirmation emails logged	System Logs > Emails; subject 'Your Request for the issue has been submitted.'
Platform availability	24x7 (ServiceNow platform SLA)	Flow active continuously since publication (Deactivate button present, flow remained Active through instance restart)

Conclusion

The automation meets the performance expectations for a school helpdesk workload: classification is effectively instantaneous to the caller, no failures were observed across repeated runs, and the flow remained active and stable across an instance restart.
